

esm_pa, lag 1

Points: observed (4000 of 5191 shown). 3.3% fall outside the 95% region (orange); about 1% fall outside the 80% region (dark blue); about 0.3% fall outside the 50% region (medium blue).

Model predictive region

95%

80%

50%

Phase plane: rate of change against the value it started from, shaded by the 50, 80 and 95% predictive regions. A linear model implies a band sloping down at the drift rate, the same everywhere. Observed points that curve, or that flatten at the extremes while the regions do not, indicate nonlinear dynamics. See `ctPhasePortrait()` for the model side of this on its own.
